

WILLIAM T. FARRINGTON, M.D.

williamtfarrington.com — 713-294-4547 — william.t.farrington@gmail.com

I am a board-certified internal medicine physician and acute care hospitalist. Texas shaped me from start to finish: biomedical engineering and medical school at Texas A&M, internal medicine residency at Texas Health Presbyterian Hospital in Dallas, and two years as an assistant professor in the Hospitalist Division of McGovern Medical School's Department of Emergency Medicine, practicing at Memorial Hermann Hospital-Texas Medical Center. In the spring of 2026, my fiancée and I relocated to Philadelphia, where she is beginning doctoral training in clinical psychology with a focus on couples therapy, and I, newly Pennsylvania-licensed, am planting professional roots of my own.

My clinical foundation is high-volume, high-acuity inpatient medicine. Working within a hospitalist group that manages over 40% of admissions at our institution, I routinely carried censuses of more than 20 medically and sociomedically complex patients, many underinsured and without stable housing or dependable outpatient continuity. My primary scope spanned rapid responses and code events, goals-of-care and end-of-life facilitation, and continuous coordination across medical, surgical, and allied health teams. I staffed admissions with internal medicine residents and delivered an annually revised triage primer to incoming interns. Private tracking of my own performance consistently demonstrated 70 to 80% census turnover per seven-day block and low-single-digit length-of-stay averages, and my work earned written commendations for both documentation compliance and intra-departmental relations.

A distinguishing feature of my practice, inherited from the group that shaped it, is secondary scope extending well past the bedside. I provided intermittent triage services in collaboration with the emergency department, intensive care units, and transfer center, and I attended most frequently on our neurologic, transplant, and oncologic medicine service lines. Off the floors, I served as a root-cause analyst for our division's quality assurance committee, participated in our medicine service line's accountable care organization, contributed to a physician-APP workflow optimization task force, and completed credentialing to work directly with EHR data through Epic SlicerDicer in support of capacity management dashboard analytics. I was also a serial "early user" – edge-case tester, pilot user, and viability analyst – across three separate AI implementations: the Viz.ai aortic dissection classifier, the Ambiance AI scribe, and the Regard AI EHR copilot. I maintain a working clinical proficiency in Spanish.

My physician identity is also firmly grounded in my engineering background. What began as undergraduate coursework has matured, longitudinally and largely after hours, into working fluency with Python, SQL, and Bash, and into data engineering projects I build and maintain myself. I am currently working on two public projects: *hupsim*, an OSINT-derived, room-level hospital capacity model built entirely from cited public sources, with the Hospital of the University of Pennsylvania serving as its inaugural example, and *mimicwarehouse*, a local governance-first data warehouse over MIMIC-IV, under active development and meant to carry the full data science cycle from exploratory to prospective analysis. Other projects remain in private development, some professional and some purely for fun. My conviction across all of them is dual: modern physicians deserve modern tools, and those tools must never compromise information sovereignty.

Away from the hospital, I am an open-water diver, a student of calisthenics and functional mobility, a mindfulness meditator, an improvising pianist, and a camper partial to dark skies. My fiancée and I are slowly assembling our list of favorite Philadelphia restaurants, music venues, and public parks. This summer and fall, I am seeing my first Dungeons & Dragons campaign through to its end with lifelong friends; none of us has ever played before. I came to Philadelphia to build a life, personal and professional alike, and I intend to be in it for the long haul.
